Deployment Instructions

1. **Setting Up MySQL (Database)**

   - Connect to your local instance of MySQL server and create a database named Hoadb
   - Ensure there is no users table in the database before the first run of the web application

2. **Create a .env file**

   - Following the template from .env.example, create a separate .env file
   - Fill up the missing details depending on your MySQL Server Setup
   - **Note**: Default setup for local instances:

        SQL_HOST="localhost"
        SQL_USER="root"
        SQL_PASSWORD=""

3. **Running the web application**

   - Install node dependencies through the command npm i or ***npm install***
   - You can start the web application through the commands: ***node app.js*** | npm run start | npm run dev for nodemon
   - To view the web application, go to http://localhost:3307/ (**Note**: The localhost port depends on the PORT field in the .env file)
   - For testing purposes, a default admin account is created at the first run of the web application

        Email: admin@user.com
        Password: admin123
